LIST OF TABLES

1. INTRODUCTION

Phillip Rowell and Associates (PRA) has been retained to prepare the following traffic analysis report for Lihue Town Core Urban Design Plan. PRA is a sub-consultant to PBR Hawaii, Inc. on this project.

This introductory chapter presents the purpose and objective of the study, the study area, methodology and order of presentation.

Objective of Study

The objectives of this study are:

1. Identify and quantify existing vehicular deficiencies within the study area, including pedestrian circulation issues.

2. Estimate future traffic projections for the study intersections and roadway facilities within the study area.

3. Identify and develop traffic engineering solutions to address short-term and long-term transportation deficiencies, including traffic management and calming programs.

Study Methodology

1. Previously completed traffic studies for the area were obtained, reviewed and summarized.

2. An inventory of existing transportation facilities in the study area was performed. The following characteristics of the roadway network were identified:

    1. Classification and jurisdiction of roadways
    2. Existing roadway cross-sections
    3. Intersection lane configurations
    4. Traffic control devices
    5. Major traffic generators, such as schools and shopping districts

3. The data obtained during the inventory and review of previous studies were used to design and perform the following traffic surveys:

    a. Existing morning and afternoon peak hour traffic volumes for the study intersections were obtained and summarized.

    b. Existing operating conditions of the study intersections were evaluated with a level-of-service analysis using AM and PM traffic data obtained during the traffic surveys. The methodology described in the *2000 Highway Capacity Manual* (HCM) was used to estimate the existing levels-of-service at the study intersections.

4. The results of the traffic surveys and analyses were used to identify and quantify existing deficiencies. The deficiencies were quantified relative to delays, volume-to-capacity ratios and levels-of-service.

5. Future traffic conditions in the study area were estimated based on future roadway and development projects in the area, anticipated background traffic growth and traffic projections provided in the *Kauai Long-Range Land Transportation Plan*.

6. Traffic and transportation improvements needed to mitigate existing and near term deficiencies in the study area were identified.

7. The potential transportation improvements were evaluated using established criteria. The criteria included, but was not limited to the following:

    1. Final volume-to-capacity ratio
    2. Reduction in vehicular delay
    3. Pedestrian circulation

8. Conclusions of the analyses performed and recommendations were summarized in a report.

Study Area

The study area and the study intersections are shown as Figure 1. The study area is bounded by Kuhio Highway, Ahukini Road, Kapule Highway and Rice Street. This area includes Hardy Street, Akahi Street, Elua Street and Umi Street.

The study area for the project includes the following intersections:

1. Kuhio Highway at Rice Street
2. Haleko Street at Rice Street
3. Eiwa Street at Rice Street
4. Umi Street at Rice Street
5. Hardy Street/Kalena Street at Rice Street
6. Hoolako Street at Rice Street
7. Kapule Highway at Rice Street
8. Kuhio Highway at Hardy Street
9. Akahi Street at Hardy Street
10. Eiwa Street at Hardy Street
11. Elua Street at Hardy Street
12. Umi Street at Hardy Street
13. Kuhio Highway at Oxford Street
14. Akahi Street at Ahukini Road
15. Elua Street at Ahukini Road
16. Umi Street at Ahukini Road
17. Palai Street at Ahukini Road
18. Kapule Highway at Ahukini Road
19. Kapule Highway at Ka'ana Street

Order of Presentation

Chapter 2 describes existing traffic conditions, the Level-of-Service (LOS) concept and the results of the Level-of-Service analysis of existing conditions.

Chapter 3 describes the alternative future roadway networks.

Chapter 4 presents the 2020 traffic forecasts for the alternative roadway networks described in Chapter 3.

Chapter 5 describes the criteria used to evaluate the alternatives, identifies deficiencies and presents the final recommendations.

Chapter 6 presents conceptual designs for Rice Street between Kuhio Highway and Umi Street, Hardy Street between Kuhio Highway and Umi Street and Ahukini Road between Kuhio Highway and Umi Street.

2. ANALYSIS OF EXISTING CONDITIONS

This chapter presents the existing traffic conditions on the roadways adjacent to and within the study area. The level-of-service (LOS) concept and the results of the Level-of-Service analysis for existing conditions are also presented.

Existing Street Network

The existing street network is shown as Figure 1. Shown are the existing streets and the study intersections. All of the streets within the study area are two-lane, two-way roadways except Kuhio Highway and Rice Street, which are both four-lanes wide. Along Rice Street, parking is allowed along both sides during the off-peak hours. Parking is prohibited from 7:00 AM to 9:00 AM and from 3:00 PM to 5:00 PM on weekdays.

Existing Peak Hour Traffic Volumes

The existing morning and afternoon peak hour traffic volumes are shown in Figures 2 and 3, respectively. The peak hour volumes at the intersections adjacent to the Civic Center were obtained from the traffic study for the Lihue Civic Center Site Improvement Project. The peak hour volumes for the remaining intersections were determined from manual traffic counts.

1. The counts were performed during the first week of November 2004.

2. The counts shown include buses, large vehicles and motorcycles. They do not include bicycles and mopeds.

3. The total approach and departure volumes may not match those of adjacent intersections because the peak hour of one intersection may be different from that of an adjacent intersection and because there are driveways and on-street parking between intersections.

4. The peak hours of the intersections counted for this project are shown in Table 1. The remaining intersections were counted for the Civic Center TIAR, which indicated that the peak hours are from 7:15 to 8:15 AM and from 4:00 to 5:00 PM.

Table 1 Peak Hours of Study Intersections

Intersection No.	Intersection	AM Peak Hour	PM Peak Hour
5	Kalena Street at Rice Street	7:15 - 8:15	4:45 - 5:45
6	Hoolako Street at Rice Street	7:30 - 8:30	3:30 - 4:30
7	Kapule Highway at Rice Street	7:00 - 8:00	4:00 - 5:00
13	Kuhio Highway at Ahukini Road / Oxford Street	7:15 - 8:15	4:00 - 5:00
14	Akahi Street at Ahukini Road	7:45 - 8:45	3:30 - 4:30
15	Elua Street at Ahukini Road	7:15 - 8:15	4:00 - 5:00
16	Umi Street at Ahukini Road	7:00 - 8:00	4:00 - 5:00
17	Palai Street at Ahukini Road	7:00 - 8:00	4:30 - 5:30
18	Kapule Highway at Ahukini Road	7:15 - 8:15	3:30 - 4:30
19	Kapule Highway at Ka Ana Road	7:30 - 8:30	3:30 - 4:30

Level-of-Service Concept

Signalized Intersections

"Level-of-Service" is a term which denotes any of an infinite number of combinations of traffic operating conditions that may occur on a given lane or roadway when it is subjected to various traffic volumes. Level-of-service is a qualitative measure of the effect of a number of factors which include space, speed, travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience.

There are six levels-of-service, A through F, which relate to the driving conditions from best to worst, respectively. The characteristics of traffic operations for each level-of-service are summarized in Table 2. In general, Level-of-Service A represents free-flow conditions with no congestion. Level-of-Service F, on the other hand, represents severe congestion with stop-and-go conditions.

Corresponding to each level-of-service shown in the table is a volume/capacity ratio. This is the ratio of either existing or projected traffic volumes to the capacity of the intersection. Capacity is defined as the maximum number of vehicles that can be accommodated by the roadway during a specified period of time. The capacity of a particular roadway is dependent upon its physical characteristics such as the number of lanes, the operational characteristics of the roadway (one-way, two-way, turn prohibitions, bus stops, etc.), the type of traffic using the roadway (trucks, buses, etc.) and turning movements.

Table 2 Level-of-Service Definitions for Signalized Intersections(1)

Level of Service	Interpretation	Volume-to-Capacity Ratio(2)	Stopped Delay (Seconds)
A, B	Uncongested operations; all vehicles clear in a single cycle.	0.000-0.700	<20.0
C	Light congestion; occasional backups on critical approaches	0.701-0.800	20.1-35.0
D	Congestion on critical approaches but intersection functional. Vehicles must wait through more than one cycle during short periods. No long standing lines formed.	0.801-0.900	35.1-55.0
E	Severe congestion with some standing lines on critical approaches. Blockage of intersection may occur if signal does not provide protected turning movements.	0.901-1.000	55.1-80.0
F	Total breakdown with stop-and-go operation	>1.001	>80.0

Notes:
(1) Source: *Highway Capacity Manual*, 2000.
(2) This is the ratio of the calculated critical volume to Level-of-Service E Capacity.

Level-of-service D is typically considered acceptable for peak hour conditions in urban areas. To be consistent with the conclusions of the TIAR for the Lihue Civic Center Master Plan, Level-of-Service E is considered acceptable under certain circumstances. "Although this level is generally considered undesirable for a signalized intersection, Level-of-Service E is sometimes tolerated for minor movements such as left turns when there are no feasible mitigating measures or if it helps maintain the main through movements at acceptable levels-of-service."[1]

[1] M&E Pacific, Inc. *Traffic Impact Analysis Report for Lihue Civic Center Master Plan*, October 2005, p. 25

Unsignalized Intersections

Like signalized intersections, the operating conditions of intersections controlled by stop signs can be classified by a level-of-service from A to F. However, the method for determining level-of-service for unsignalized intersections is based on the use of gaps in traffic on the major street by vehicles crossing or turning through that stream. Specifically, the capacity of the controlled legs of an intersection is based on two factors: 1) the distribution of gaps in the major street traffic stream, and 2) driver judgement in selecting gaps through which to execute a desired maneuver. The criteria for level-of-service at an unsignalized intersection is therefore based on delay of each controlled lane group. Table 3 summarizes the definitions for level-of-service and the corresponding delay. ***The lane group with the lowest level-of-service defines the level-of-service of the overall unsignalized intersection.*** This means that if all the controlled movements of an unsignalized intersection operate at Level-of-Service B except one that is Level-of-Service F, the intersection Level-of-Service is F.

Table 3 Level-of-Service Definitions for Unsignalized Intersections(1)

Level-of-Service	Expected Delay to Minor Street Traffic	Delay (Seconds)
A	Little or no delay	<10.0
B	Short traffic delays	10.1 to 15.0
C	Average traffic delays	15.1 to 25.0
D	Long traffic delays	25.1 to 35.0
E	Very long traffic delays	35.1 to 50.0
F	See note (2) below	>50.1

Notes:
(1) Source: *Highway Capacity Manual*, 2000.
(2) When demand volume exceeds the capacity of the lane, extreme delays will be encountered with queuing which may cause severe congestion affecting other traffic movements in the intersection. This condition usually warrants improvement of the intersection.

Level-of-Service Analysis of Existing Conditions

The results of the level-of-service analysis of the study intersections are summarized in Table 4. Shown in the table are the level-of-service of the overall intersection for signalized intersection and the lowest level-of-service of the controlled lane groups for the unsignalized intersections. Lastly, the levels-of-service shown are defined by delay rather than volume-to-capacity ratio.

A detailed summary of the level-of-service analysis results is presented as Appendix A.

Table 4 Existing (2004) Levels-of-Service [(1),(2)]

No.	Intersection	Right-of-Way Control	AM Peak Hour Level-of-Service	PM Peak Hour Level-of-Service	Conclusions and Comments
1	Kuhio Hwy at Rice St	Signalized	B	B	All movements are C, or better.
2	Haleko St at Rice St	Unsignalized	C	C	All movements operate at B and C.
3	Eiwa St at Rice St	Unsignalized	E	F	Southbound left operates at E during AM and F during PM. Remaining movements operate at C, or better.
4	Umi St at Rice St	Signalized	B	B	All movements operate at B, or better.
5	Hardy St at Rice St	Signalized	A	A	All movements operate at A and B.
6	Hoolako St at Rice St	Signalized	B	B	All movements operate at B, or better.
7	Kapule St at Rice St	Unsignalized	E	F	Southbound left operates at E and F during AM and PM, respectively. Intersection is to be reconfigured and signalized by SDOT. Design is underway.
8	Kuhio Hwy at Hardy St	Unsignalized	F	F	Westbound left operates at F during AM and PM.
9	Akahi St at Hardy St	Unsignalized	C	C	All movements operate at C, or better.
10	Eiwa St at Hardy St	Unsignalized	E	D	Northbound left operates at E during AM (39.3 seconds per vehicle), but is acceptable of short periods during peak periods. All other movements operate at D, or better.
11	Elua St at Hardy St	Unsignalized	C	C	All movements operate at C, or better.
12	Umi St at Hardy St	Unsignalized	F	F	Northbound approach operates at F during AM and PM. All other movements operate at D, or better.
13	Kuhio Hwy at Ahukini Rd	Signalized	B	C	Westbound left operates at E during AM and F during PM. All other movements operate at D, or better.
14	Akahi St at Ahukini Rd	Unsignalized	C	C	All movements operate at C, or better.
15	Elua St at Ahukini Rd	Unsignalized	C	D	All movements operate at D, or better.
16	Umi St at Ahukini Rd	Unsignalized	F	F	Northbound left operates at F during AM and PM.
17	Palai St at Ahukini Rd	Unsignalized	D	D	All movements operate at D, or better.
18	Kapule Hwy at Ahukini Rd	Signalized	D	D	Eastbound left and westbound left operate a F and E during AM. Eastbound left operates at F during PM and northbound thru and southbound left operates at E. All remaining movements operate at D, or better.
19	Kapule Hwy at Ka Ana St	Signalized	A	A	All movements operate at D, or better.

NOTES:
(1) The delays and levels-of-service shown for unsignalized intersections is the delay and level-of-service of the worse movement or lane group.
(2) Level-of-Service was calculated using the operations method described in *Highway Capacity Manual*. Level-of-Service is based on delay
(3) See Appendix B for detailed levels-of-service analysis results.
(4) See Appendix C for level-of-service analysis worksheets.

The conclusions of the level-of-service analysis are that the following intersections operate at Level-of-Service E or F, which are unacceptable levels-of-service:

	Intersection	AM	PM
1.	Eiwa Street at Rice Street	E	F
2.	Kapule Highway at Rice Street	E	F
3.	Kuhio Highway at Hardy Street	F	F
4.	Eiwa Street at Hardy Street	E	D
5.	Umi Street at Hardy Street	F	F
6.	Umi Street at Ahukini Road	F	F

The following improvements are in the planning or design phase and will mitigate the poor levels-of-service at the respective intersections:

1. Improvements for the intersection of Kapule Highway at Rice Street being designed by State of Hawaii Department of Transportation. These improvements consists of redesign of the intersection such that the Kapule Highway-Nawiliwili movement is a through movement and installation of traffic signals.

2. The County of Kauai Department of Public Works is planning to signalize the intersection of Hardy Street at Kuhio Highway and construct a roundabout at the intersection of Hardy Street at Umi Street as part of the Lihue Civic Center Site Improvements project. The timing of these improvement is not determined at this time.

3. FUTURE ROADWAY NETWORKS

The purpose of this chapter is to discuss the assumptions and data used to estimate 2020 traffic conditions.

Future traffic growth consists of two components. The first is ambient background growth that is a result of regional growth and cannot be attributed to a specific project. The second component is estimated traffic that will be generated by other development projects in the vicinity of the proposed project.

Design, or Horizon, Year

The design, or horizon, year is the future date for which traffic forecasts are developed. The year 2020 was selected as the design, or horizon, year. This year was selected because it is consistent with the *Kauai Long Range Land Transportation Plan*, completed in May, 1997. We are not aware of any updates planned or in progress.

Network A

Network A reflects the existing roadway network plus the following proposed or in progress roadway projects:

1. Kaumualii Highway is widened from two to four lanes south of Rice Street

2. The intersection of Rice Street at Kapule Highway is reconstructed and signalized.

3. Ahukini Road east of Kuhio Highway has been realigned so that the intersection with Kuhio Highway is relocated approximately one block north of the existing intersection. Ahukini Road will align with Ehiku Street.

4. Ahukini Road is widened from two to four lanes between Kuhio Highway and Kapule

Highway.

5. Kapule Highway is widened from two to four lanes between Ahukini Road and Rice Street.

6. The street network as shown is the Lihue-Hanama'ulu Master Plan has been completed. This includes extending Kaana Street to Kapule Highway and Ho`olako Street to Ahukini Road.

7. The intersection of Kuhio Highway at Hardy Street is signalized.

8. The intersection of Hardy Street at Umi Street is reconstructed with a roundabout as described in the Lihue Civic Center Master Plan TIAR.

9. Umi Street is extended north of Ahukini Road.

Network A is shown as Figure 4.

Network B - Proposed Network A Plus Lihue Bypass

Network B is shown as Figure 5. This network consists of the existing roadway network, Network A and the Lihue Bypass. The alignment shown for the Bypass is taken from the *Kauai Long Range Land Transportation Plan*. The bypass is described as "a new four-lane divided roadway between Kipu and the north side of Lihue-Hanamaulu town with a two-lane connector road to Kaumualii Highway at Nuhou Road, a two-lane connector road at Nawiliwili Road and a two-lane connector road to Kuhio Highway at Ehiku Street."[2]

Rice Street Alternatives

Alternative configurations for Rice Street were assessed early in the study. The objective of the alternative assessment was to determine if the width of Rice Street could be reduced from four to two lanes with a center turn lane to provide space for wider sidewalks and bicycle lanes and enhance the pedestrian feeling of the area. In addition, the viability of converting Rice Street and Hardy Street into a one-way couplet was part of the analysis in order to make up for the lost capacity.

Upon study of the traffic projections for both networks, it was determined that reduction of the width of Rice Street from four to two lanes would divert too much peak hour traffic for Hardy Street to accommodate as a two-lane road. Additionally, a public survey concluded that there was little community support for the one-way alternative. Accordingly, the alternatives were not studied further.

[2] Austin, Tsutsumi & Associates, Inc., *Kauai Long Range Land Transportation Plan*, May 1997, page ES-18

4. 2020 TRAFFIC FORECASTS AND LEVEL-OF-SERVICE ANALYSIS

Background Traffic Growth

The *Kauai Long Range Land Transportation Plan*[3] concluded that traffic along various roadways within the study area would increase between 1.2% per year and 2.3% per year from 1994 to 2020. A weighted average growth rate of 1.6% was used to estimate the background growth between 2004 and 2020, which is the design year for this project. The growth factor was calculated to be 1.29 using the following formula:

$$F = (1 + i)^n$$

where F = Growth Factor
i = Average annual growth rate, or 0.016
n = Growth period, or 3 years

As will be discussed in the following section, this factor was reduced by 50% to account for potential double counting of traffic generated by related projects.

[3] Austin, Tsutsumi & Associates, May 1997

Related Development Projects

The second component in estimating background traffic volumes is traffic resulting from other proposed projects in the vicinity. Related projects are defined as those projects that are under construction, have been approved for construction or have a high probability of being constructed and would significantly impact traffic in the study area. Related projects may be development projects or roadway improvements.

The following projects were identified as related projects:

1. Civic Center, which includes closure of Eiwa Street between Hardy Street and Rice Street
2. Lihue-Hanamaulu
3. Costco
4. Puakea Development

It was determined that traffic associated with all of the related projects are within the 2020 forecasts provided by the *Kauai Long Range Land Transportation Plan*. However, traffic associated with the Lihue-Hanamaulu project appeared to be greater than traffic estimated in the *Kauai Long Range Land Transportation Plan*. Accordingly, a separate trip generation and assignment analysis was performed for this particular project. See Appendix A. The project description and trip distribution data provided in the traffic impact study for Lihue-Hanamaulu was used as the basis for these calculations.

The background growth rate was reduced by 50% to avoid double counting the estimated background traffic generated by the Lihue-Hanamaulu project and what was reported in the *Kauai Long-Range Land Transportation Plan*.

2020 Traffic Forecasts

2020 cumulative traffic projections were calculated by expanding existing traffic volumes by the appropriate background growth rate and then superimposing traffic generated by related projects. The resulting 2020 peak hour traffic forecasts for the existing roadway network, referred to as Baseline, are shown as Figures 6 and 7. The 2020 peak hour traffic forecasts for Network A are shown in Figures 8 and 9 and the 2020 peak hour traffic forecasts for Network B are shown in Figures 10 and 11.

Level-of-Service Analysis for 2020 Conditions

2020 Baseline Conditions

The 2020 Baseline conditions represent the 2020 traffic projections on the existing roadway network. None of the improvements previously noted in this report are considered in this scenario. This is a "No Build Scenario."

The results of the level-of-service analysis for 2020 Baseline conditions are summarized in Table 5. Shown are the levels-of-service of the study intersections for 2020 traffic projections for existing intersection and roadway conditions. For this scenario, the following intersections will operate at Level-of-Service E or F:

	Intersection	AM	PM
1.	Eiwa Street at Rice Street	F	F
2.	Kapule Highway at Rice Street	F	F
3.	Kuhio Highway at Hardy Street	F	F
4.	Akahi Street at Hardy Street	D	F
5.	Eiwa Street at Hardy Street	F	F
6.	Elua Street at Hardy Street	E	E
7.	Umi Street at Hardy Street	F	F
8.	Kuhio Highway at Ahukini Road	E	E
9.	Akahi Street at Ahukini Road	E	F
10.	Elua Street at Ahukini Road	F	D
11.	Umi Street at Ahukini Road	F	F
12.	Palai Street at Ahukini Road	F	F
13.	Kapule Highway at Ahukini Road	E	F

Table 5 Results of Levels-of-Service Analysis of 2020 Baseline Conditions [(1),(2)]

No.	Intersection	Right-of-Way Control	AM Peak Hour Level-of-Service	PM Peak Hour Level-of-Service	Conclusions and Comments
1	Kuhio Hwy at Rice St	Signalized	D	D	Northbound thru operates at F during AM. During PM, westbound and northbound left operates at F.
2	Haleko St at Rice St	Unsignalized	D	D	All movements operate at D, or better, AM and PM.
3	Eiwa Street at Rice Street	Unsignalized	F	F	Southbound left operates at F, AM and PM. All other movements are D, or better.
4	Umi St at Rice St	Signalized	B	B	All movements are B, or better.
5	Hardy St at Rice St	Signalized	B	B	All movements are B, or better.
6	Hoolako St at Rice St	Signalized	B	C	All movements are D, or better.
7	Kapule St at Rice St	Unsignalized	F	F	Southbound left operates at F, AM and PM. All other movements are C, or better.
8	Kuhio Hwy at Hardy St	Unsignalized	F	F	Westbound left and Southbound left are F during AM. Westbound left and right are F during PM.
9	Akahi St at Hardy St	Unsignalized	D	F	Southbound left is F during PM.
10	Eiwa St at Hardy St	Unsignalized	F	F	Northbound left is F during AM and PM. All other movements are D, or better.
11	Elua St at Hardy St	Unsignalized	E	E	Eastbound left and thru is A, AM and PM. Southbound left and right is E, AM and PM.
12	Umi St at Hardy St	Unsignalized	F	F	Northbound and Southbound approaches are F during the AM and PM.
13	Kuhio Hwy at Ahukini Rd	Signalized	E	E	Only Northbound approach is acceptable. All other movements are E or F.
14	Akahi St at Ahukini Rd	Unsignalized	E	F	Northbound approach operates at E during AM and F during PM. Other movements are A.
15	Elua St at Ahukini Rd	Unsignalized	F	D	Northbound left operates at F during AM. All other movements are D, or better.
16	Umi St at Ahukini Rd	Unsignalized	F	F	Northbound operates at F, AM and PM.
17	Palai St at Ahukini Rd	Unsignalized	F	F	Northbound operates at F, AM and PM.
18	Kapule Hwy at Ahukini Rd	Signalized	E	F	Only 5 of 12 movements are acceptable during AM. Only 3 are acceptable during PM.
19	Kapule Hwy at Ka Ana St	Signalized	A	C	Northbound left is F during AM. All others are D, or better.

NOTES:
(1) The delays and levels-of-service shown for unsignalized intersections is the delay and level-of-service of the worse movement or lane group.
(2) Level-of-Service was calculated using the operations method described in *Highway Capacity Manual*. Level-of-Service is based on delay

Network A

The results of the level-of-service analysis for Network A are summarized in Table 6. Shown are the overall levels-of-service for the study intersections. Detailed results indicating the delay and level-of-service of each lane group is presented as Appendix B.

The assumptions used for the level-of-service analysis are:

1. Kaumualii Highway is widened from two to four lanes south of Rice Street

2. The intersection of Rice Street at Kapule Highway is reconstructed and signalized.

3. Ahukini Road east of Kuhio Highway has been realigned. The old alignment of Ahukini Road is referred to as Old Ahukini Road.

4. The old intersection of Ahukini Road at Kuhio Highway is retained but only right turns in and right turns out will be allowed. Left turns will not be allowed because queues from the new intersection.

5. Umi Street is extended across Ahukini Road and behind Walmart to the hospital. The intersection of Ahukini Road at Umi Street is signalized

6. Akahi Street is extended from Old Ahukini Road to the new Ahukini Road. The intersection of Ahukini Road is restricted to right turns only because the turn queue from Kuhio Highway.

7. Ahukini Road is widened from two to four lanes between Kuhio Highway and Kapule Highway.

8. Kapule Highway is widened from two to four lanes between Ahukini Road and Rice Street.

9. Kaana Street is extended to Kapule Highway.

10. Ho'olako Street is extended to Ahukini Road.

11. The intersection of Kuhio Highway at Hardy Street is signalized.

12. The intersection of Hardy Street at Umi Street is converted to a roundabout.

13. Eiwa Street between Hardy Street and Rice Street is demolished.

Network B

The results of the level-of-service analysis for Network B are summarized in Table 7. Detailed results indicating the delay and level-of-service of each lane group is presented as Appendix B.

Table 6 Results of Level-of-Service Analysis of 2020 Network A Conditions [(1),(2)]

No.	Intersection	Right-of-Way Control	AM Peak Hour Level-of-Service	PM Peak Hour Level-of-Service	Conclusions and Comments
1	Kuhio Hwy at Rice St	Signalized	C	C	Northbound thru is F during AM and PM. Westbound left is F during PM only. All other movements operate at Level-of-Service D, or better.
2	Haleko St at Rice St	Unsignalized	D	D	All movements operate at Level-of-Service D, or better, AM and PM.
3	Eiwa St at Rice St	Removed	-	-	Eiwa Street removed as part of Lihue Civic Center improvements.
4	Umi St at Rice St	Signalized	B	B	All movements operate at Level-of-Service A or B.
5	Hardy St at Rice St	Signalized	B	B	All movements operate at Level-of-Service B, or better.
6	Hoolako St at Rice St	Signalized	B	C	All movements operate at Level-of-Service D, or better.
7	Kapule St at Rice St	Signalized	B	C	All movements operate at Level-of-Service D, or better.
8	Kuhio Hwy at Hardy St	Signalized	C	C	Traffic signals are installed. Southbound left operates at E during PM.
9	Akahi St at Hardy St	Unsignalized	F	F	Northbound and Southbound approaches operate at F, AM and PM. Other movements are A. Signalization should be considered when warrants are met. Signalization will improve the level-of-service to C or better during both AM and PM peak periods.
10	Eiwa St at Hardy St	Removed	-	-	Eiwa Street removed as part of Lihue Civic Center improvements.
11	Elua St at Hardy St	Unsignalized	E	E	Southbound left and right are E, AM and PM. Eastbound left and thru are A, AM and PM.
12	Umi St at Hardy St	Roundabout	D	B	Level-of-Service D, or better during AM. Level-of-Service B, or better during PM.
13	Kuhio Hwy at Ahukini Rd "New"	Signalized	B	C	Southbound left is E during PM. All other movements Level-of-Service D, or better, AM and PM.
14	Akahi St at Ahukini Rd "New"	Unsignalized	B	B	All movements Level-of-Service B, or better.
15	Elua St at Ahukini Rd "New"	Not Applicable	-	-	No intersection created.
16	Umi St at Ahukini Rd "New"	Signalized	B	B	All movements Level-of-Service D, or better.
17	Palai St at Ahukini Rd	Unsignalized	F	E	Northbound left is F during AM and E during PM. All other movements are A or B.
18	Kapule Hwy at Ahukini Rd	Signalized	C	C	Westbound left is E during AM. All other movements are D, or better.
19	Kapule Hwy at Ka Ana St	Signalized	C	B	Northbound left is Level-of-Service F during the AM. All remaining movements are D or better.

NOTES:
(1) The delays and levels-of-service shown for unsignalized intersections is the delay and level-of-service of the worse movement or lane group.
(2) Level-of-Service was calculated using the operations method described in *Highway Capacity Manual*. Level-of-Service is based on delay

Table 7 Results of Level-of-Service Analysis of 2020 Network B Conditions (1),(2)

No.	Intersection	Right-of-Way Control	AM Peak Hour Level-of-Service	PM Peak Hour Level-of-Service	Conclusions and Comments
1	Kuhio Hwy at Rice St	Signalized	C	C	Southbound left is E during PM. All other movements are D, or better. The Bypass will divert 650 vehicles per hour during the morning peak hour and 450 during the afternoon peak hour from Kuhio Highway.
2	Haleko St at Rice St	Unsignalized	D	D	All movements operate at Level-of-Service D, or better, AM and PM.
3	Eiwa St at Rice St	Removed	-	-	Eiwa Street removed as part of Lihue Civic Center improvements.
4	Umi St at Rice St	Signalized	B	B	All movements operate at Level-of-Service C, or better.
5	Hardy St at Rice St	Signalized	B	B	All movements operate at Level-of-Service B, or better.
6	Hoolako St at Rice St	Signalized	B	C	All movements operate at Level-of-Service D, or better.
7	Kapule St at Rice St	Signalized	B	C	All movements operate at Level-of-Service D, or better.
8	Kuhio Hwy at Hardy St	Signalized	C	C	All movements are D, or better.
9	Akahi St at Hardy St	Unsignalized	F	F	Northbound and Southbound approaches operate at F, AM and PM. Other movements are A. Signalization should be considered when warrants are met. Signalization will improve the level-of-service to C or better during both AM and PM peak periods.
10	Eiwa St at Hardy St	Removed	-	-	Eiwa Street removed as part of Lihue Civic Center improvements.
11	Elua St at Hardy St	Unsignalized	E	E	Southbound left and right are E, AM and PM. Eastbound left and thru are A, AM and PM.
12	Umi St at Hardy St	Roundabout	D	B	Level-of-Service D, or better during AM. Level-of-Service B, or better during PM.
13	Kuhio Hwy at Ahukini Rd "New"	Signalized	C	C	Eastbound left and northbound left is F during AM. Eastbound left is F and westbound left is E during PM.
14	Akahi St at Ahukini Rd "New"	Unsignalized	B	B	All movements Level-of-Service B, or better.
15	Elua St at Ahukini Rd "New"	Not Applicable	-	-	No intersection created.
16	Umi St at Ahukini Rd "New"	Signalized	B	B	All movements Level-of-Service D, or better.
17	Palai St at Ahukini Rd	Unsignalized	F	E	Northbound left is F during AM and E during PM. All other movements are D, or better.
18	Kapule Hwy at Ahukini Rd	Signalized	C	C	Eastbound left and westbound left is E during AM. All other movements are D, or better.
19	Kapule Hwy at Ka Ana St	Signalized	C	B	Northbound left is Level-of-Service F during the PM. All remaining movements are D or better.

NOTES:
(1) The delays and levels-of-service shown for unsignalized intersections is the delay and level-of-service of the worse movement or lane group.
(2) Level-of-Service was calculated using the operations method described in *Highway Capacity Manual*. Level-of-Service is based on delay

5. CONCLUSIONS AND RECOMMENDATIONS

Planning Criteria

The Institute of Transportation Engineers recommends that Level-of-Service D should be the minimum acceptable level-of-service for urban peak hour conditions. Accordingly, this criterion has been used for this study.

Level-of-service D is typically considered acceptable for peak hour conditions in urban areas. To be consistent with the conclusions of the TIAR for the Lihue Civic Center Master Plan, Level-of-Service E is considered acceptable under certain circumstances. "Although this level is generally considered undesirable for a signalized intersection, Level-of-Service E is sometimes tolerated for minor movements such as left turns when there are no feasible mitigating measures or if it helps maintain the main through movements at acceptable levels-of-service."[4]

[4] M&E Pacific, Inc. *Traffic Impact Analysis Report for Lihue Civic Center Master Plan*, October 2005, p. 25

Conclusions and Recommendations

1. Rice Street at Kuhio Highway

Currently, this intersection operates at Level-of-Service B during both peak periods. All movements operate at Level-of-Service C, or better.

For 2020 Baseline conditions, the intersection will operate at Level-of-Service D during both peak periods. During the morning peak hour, the northbound through movement will operate at Level-of-Service F. The remaining movements will operate at Level-of-Service C, or better. During the afternoon peak hour, the westbound left and right and the northbound through movement will operate at Level-of-Service F and the remaining movements will operate at Level-of-Service C, or better.

For 2020 Network A conditions, the intersection will operate at Level-of-Service C, during both peak periods. During the morning peak hour, the southbound left turn will operate at Level-of-Service E and the remaining movements will operate at Level-of-Service D, or better. During the afternoon peak hour, the westbound left turn will operate at Level-of-Service E and the southbound left turn will operate at Level-of-Service F. The remaining movements will operate at Level-of-Service D, or better.

For 2020 Network B conditions, the intersection will also operate at Level-of-Service C during both peak hours. All movements will operate at Level-of-Service D, or better, except the southbound left turn, which will operate at Level-of-Service E during the afternoon peak hour.

An alternative that improves the level-of-service to Level-of-Service B during both peak periods is discussed in Chapter 6. It involves the addition of a second left turn lane from westbound Rice Street to southbound Kuhio Highway.

2. Rice Street at Haleko Street

The westbound approach currently operates at Level-of-Service B and the northbound approach operates at Level-of-Service C during both peak periods. For 2020 conditions, the westbound approach will also operate at Level-of-Service B, but the northbound right turn will operate at Level-of-Service D during the morning peak hour. During the afternoon peak hour, both the westbound and the northbound approaches will operate at Level-of-Service D. The levels-of-service will be the same for 2020 Baseline, Network A and Network B conditions.

3. Rice Street at Eiwa Street

Currently, the southbound left turn operates at Level-of-Service E during the morning peak hour and Level-of-Service F during the afternoon peak hour. The remaining movements operate at Level-of-Service C, or better. For 2020 baseline conditions, the southbound left turn will operate at Level-of-Service F during both peak periods and the remaining movements will operate at Level-of-Service D, or better. As Eiwa Street between Hardy Street and Rice Street will be removed as part of the Civic Center Improvement project, there are no level-of-service calculations for Networks A and B.

4. Rice Street at Umi Street

The intersection operates at Level-of-Service B during both peak periods. All movements operate at Level-of-Service A or B.

For 2020 conditions (Baseline, Network A and Network B), the intersection will operate at Level-of-Service B during both peak periods and all movements will operate at Level-of-Service C, or better.

5. Rice Street at Hardy Street

The intersection operates at Level-of-Service A during both peak periods. All movements operate at Level-of-Service A or B.

For 2020 conditions (Baseline, Network A and Network B), the intersection will operate at Level-of-Service B during both peak periods and all movements will operate at Level-of-Service B, or better.

6. Rice Street at Hoolako Street

This intersection currently operates at Level-of-Service B during the morning and afternoon peak periods. All movements operate at Level-of-Service B, or better. For future conditions (Baseline, Network A and Network B), the intersection will operate at Level-of-Service B during the morning peak hour and Level-of-Service C during the afternoon peak hour. All movements will operate at Level-of-Service D, or better. The eastbound left and through lane will operate as a default left turn lane and the volume-to-capacity ratio will exceed 1.35. However, the average vehicle delay implies Level-of-Service C.

7. Rice Street at Kapule Street

This intersection is currently unsignalized. The left turn from southbound Kapule Highway at eastbound Rice Street operates at Level-of-Service E during the morning peak hour and Level-of-Service F during the afternoon peak hour. For future Baseline conditions, this left turn will operate at Level-of-Service F during both peak periods. All other movements will operate at Level-of-Service C, or better.

For Networks A and B, the intersection will be reconfigured and signalized. The left turn from southbound Kapule Highway to eastbound Rice Street, which currently operates at Level-of-Service E and F, will be the southbound through movement. For Network A and Network B conditions, the overall intersection will operate at Level-of-Service B during the morning peak hour and all movements will operate at Level-of-Service C, or better. During the afternoon peak hour, the intersection will operate at Level-of-Service C and all movements will operate at Level-of-Service D, or better.

8. Hardy Street at Kuhio Highway

This intersection is currently unsignalized and operates at Level-of-Service F during both peak periods. The westbound left operates at Level-of-Service F, but the remaining movements operate at Level-of-Service B or C.

For 2020 Baseline conditions, the intersection will also operate at Level-of-Service F. During the morning peak hour, the westbound left turn and the southbound left turn will both operate at Level-of-Service F. During the afternoon peak hour, the westbound left turn and right turn will both operate at Level-of-Service F.

The intersection will be signalized under the Network A and Network B scenarios. As a signalized intersection, the intersection will operate at Level-of-Service C during both peak periods. For Network A, all movements will operate at Level-of-Service D, or better, except the southbound left turn during the afternoon peak hour, which will operate at Level-of-Service E. For Network B conditions, all movements will operate at Level-of-Service D, or better. This is a result of diverting a portion of the northbound and southbound through traffic from Kuhio Highway to the by pass (620 vehicles per hour during the morning peak hour and 450 vehicles per hour during the afternoon peak hour).

9. Hardy Street at Akahi Street

During the morning and afternoon peak hours, all movements currently operate at Level-of-Service C, or better. For 2020 Baseline conditions, the southbound left turn will operate at Level-of-Service D during the morning peak hour and Level-of-Service F during the afternoon peak hour.

As part of the Civic Center Improvements, the new entrance to the Civic Center parking lot will be aligned with Akahi Street. Therefore, for Networks A and B, this intersection will be a four-legged intersection with the south leg as the entrance to and exit from the Civic Center parking lot. Traffic along Hardy Street will operate at Level-of-Service A, which implies that traffic turning into and out of the Civic Center will have a minimal impact on traffic operations along Hardy Street. However, traffic approaching along southbound Akahi Street and exiting the Civic Center parking lot will experience long delays and will operate at Level-of-Service F during both peak periods. This implies that the peak hour delay warrants will be satisfied and the intersection may have to be signalized for 2020 conditions. As a signalized intersection, all movements will operate at Level-of-Service C, or better during both peak periods. The overall intersection will operate at Level-of-Service B during the morning peak hour and Level-of-Service C during the afternoon peak hour. It is our understanding that this intersection will be monitored to determine when the warrants for a traffic signal are satisfied.

10. Hardy Street at Eiwa Street

Currently, the northbound left turn operates at Level-of-Service E during the morning peak hour and Level-of-Service D during the afternoon peak hour. The remaining movements operate at Level-of-Service B, or better. For 2020 baseline conditions, the northbound left turn will operate at Level-of-Service F during both peak periods and the remaining movements will operate at Level-of-Service D, or better. As the closure of Eiwa Street between Hardy Street and Rice Street is recommended as part of the Civic Center Improvement project, there are no level-of-service calculations for Networks A and B.

11. Hardy Street at Elua Street

Under existing conditions, all movements operate at Level-of-Service C, or better. The southbound left and right turns will operate at Level-of-Service E during both peak periods under Baseline, Network A and Network B conditions.

12. Hardy Street at Umi Street

Under existing conditions, this intersection operates at Level-of-Service F during both peak periods. The northbound approach of Umi Street operates at Level-of-Service F and therefore determines the level-of-service of the intersection.

For 2020 Baseline conditions, the northbound and southbound approaches of Umi Street will operate at Level-of-Service F during both peak periods. The westbound and eastbound approaches of Hardy Street will operate at Level-of-Service A during both peak periods.

For Networks A and B conditions, the intersection will be converted to a roundabout. As a roundabout, the intersection will operate at Level-of-Service D (v/c = 0.89) during the morning peak hour and Level-of-Service B during the afternoon peak hour (v/c = 0.63). These level-of-service are based on the volume-to-capacity ratio (rather than delay) which is not widely accepted to determine the level-of-service of a roundabout.

13. Ahukini Road at Kuhio Highway

Under existing conditions, the overall intersection operates at Level-of-Service B during the morning peak hour and Level-of-Service C during the afternoon peak hour. The left turns from westbound Ahukini Road to southbound Kuhio Highway operate at Level-of-Service E during the morning peak hour and Level-of-Service F during the afternoon peak hour. All remaining movements operate at Level-of-Service D, or better.

For 2020 Baseline conditions, the overall intersection will operate at Level-of-Service E during both peak hours. During the morning peak hour all movements will operate at Level-of-Service E or F except the northbound approach which will operate at Level-of-Service A and the westbound approach which will operate at Level-of-Service D. During the afternoon peak hour, all movements will operate at Level-of-Service E or F except the northbound approach which will operate at Level-of-Service B.

For Network A conditions, Ahukini Road will be realigned and will tie into the Lihue Bypass via Ehiku Street. The new intersection of Ahukini Road at Kuhio Highway will operate at Level-of-Service B during the morning peak hour and all movements will operate at Level-of-Service D, or better. During the afternoon peak hour, the overall intersection will operate at Level-of-Service C and all movements will operate at Level-of-Service D, or better, except the southbound left turn which will operate at Level-of-Service E. The recommended lane configuration is described in Chapter 6.

For Network B, Ahukini Road will also be realigned. The overall intersection will operate at Level-of-Service C during both peak periods. During the morning peak hour, the eastbound and northbound left turns will operate at Level-of-Service F. All remaining movements will operate at Level-of-Service C, or better. During the afternoon peak hour, the eastbound and westbound left turns will operate at Level-of-Service F and E, respectively. All remaining movements will operate at Level-of-Service D, or better.

The intersection of Old Ahukini Road at Kuhio Highway will have to be restricted to right turns only because of the short distance between the this intersection and the new intersection. This intersection will operate at Level-of-Service B during the morning peak hour and Level-of-Service C during the afternoon peak hour for Network A and Network B conditions.

14. Ahukini Road at Akahi Street

Currently, the northbound left and right turns operate at Level-of-Service C and the westbound through and left turns operate at Level-of-Service A. For 2020 Baseline conditions, the northbound left and right turns will operate at Level-of-Service E during the morning peak hour and Level-of-Service F during the afternoon peak hour.

For Networks A and B, Ahukini Road will be realigned as discussed earlier. The intersection of Akahi Street at the realigned Ahukini will be restricted to right turns only because of the left turn storage lane requirements of the new intersection of Ahukini Road at Kuhio Highway. The right turns will operate at Level-of-Service B during both peak periods.

The intersection of Akahi Street at Old Ahukini Road will be a four-legged, unsignalized intersection. All movements of this intersection will operate at Level-of-Service A or B.

15. Ahukini Road at Elua Street

For existing conditions, this intersection operates at Level-of-Service C during the morning peak hour and Level-of-Service D during the afternoon peak hour. The northbound left and right turns determine the level-of-service of the intersection. For 2020 Baseline conditions, the northbound left and right turns will operate at Level-of-Service F during the morning peak hour and Level-of-Service D during the afternoon peak hour.

Elua Street will not be extended from Old Ahukini Road to the realigned Ahukini Road. The intersection of Old Ahukini Road at Elua Street will be a T-intersection. This intersection will operate at Level-of-Service B during the morning peak hour and Level-of-Service A during the afternoon peak hour.

16. Ahukini Road at Umi Street

Under existing conditions, the northbound left turns operate at Level-of-Service F during both peak periods. All other movements operate at Level-of-Service A or B.

For 2020 Baseline conditions, the northbound left turns will operate at Level-of-Service F during both peak periods and all other movements will operate at Level-of-Service C, or better.

The realignment of Ahukini Road also affects this intersection. Umi Street will be extended across the realigned Ahukini Road and east of the existing Walmart. The intersection of the realigned Ahukini Road with Umi Street will have to be signalized to accommodate left turns from both approaches of Ahukini Street. As a signalized intersection, the intersection will operate at Level-of-Service B during both peak periods and all movements will operate at Level-of-Service D, or better.

The intersection of Umi Street with Old Ahukini Road will be unsignalized and will operate at Level-of-Service B during both peak periods.

17. Ahukini Road at Palai Street

Under existing conditions, all movements operate at Level-of-Service D, or better.

For 2020 Baseline conditions, the left turn from northbound Palai Street to westbound Ahukini Road will operate at Level-of-Service F during both peak periods. All remaining movements will operate at Level-of-Service C, or better.

This intersection will be unsignalized and Ahukini Road will be widened from two to four lanes for Network A and Network B conditions. For 2020 Network A and Network B conditions, the northbound left turn will operate at Level-of-Service F during the morning peak hour and Level-of-Service E during the afternoon peak hour.

18. Ahukini Road at Kapule Highway

For existing conditions, this intersection operates at Level-of-Service D during both peak periods. During the morning peak hour, the eastbound left operates at Level-of-Service F and the westbound left operates at Level-of-Service E. During the afternoon peak hour, the eastbound left operates at Level-of-Service F and the northbound through and southbound left operates at Level-of-Service E.

For 2020 Baseline conditions, the intersection will operate at Level-of-Service E during the morning peak hour and Level-of-Service F during the afternoon peak hour. During the afternoon peak hour, all movements will operate at Level-of-Service D, or worse.

For Network A and Network B conditions, Ahukini Road and Kapule Highway will be widened from two to four lanes. As a result, the intersection will operate at Level-of-Service C during both peak periods. All movements except the westbound left will operate at Level-of-Service D, or better. The westbound left will operate at Level-of-Service E during the morning peak hour and Level-of-Service D during the afternoon peak hour.

19. Kapule Highway at Ka Ana Street

Under existing conditions, this intersection operates at Level-of-Service A during both peak periods. All movements operate at Level-of-Service D, or better.

For 2020 Baseline conditions, the overall intersection will operate at Level-of-Service B during the morning peak hour and Level-of-Service C during the afternoon peak hour. All movements will operate at Level-of-Service D, or better, except the northbound left turn during the morning peak hour which will operate at Level-of-Service F.

For 2020 Network A and Network B conditions, Kapule Highway will be widened from two to four lanes. The intersection will operate at Level-of-Service C during the morning peak hour and Level-of-Service B during the afternoon peak hour. The northbound left turn will operate at Level-of-Service F during the morning peak hour, but all other movements will operate at Level-of-Service D, or better, during both peak periods.

Summary

The level-of-service analysis concluded that the several intersections within the study area will be at or over-capacity by 2020 even with the major improvements included in Network A.

The overall levels-of-service of the intersections along Kuhio Highway are acceptable. However, each intersection has lane groups or movements that operate at Level-of-Service E or F, resulting in congested conditions along Kuhio Highway.

It appears that sufficient traffic must be diverted from Kuhio Highway so that the overall intersections and all the lane groups along Kuhio Highway will operate at acceptable levels-of-service. The most viable way to accomplish this is to construct the Lihue Bypass before the levels-of-service deteriorate to unacceptable levels. For 2020 conditions with the Lihue Bypass, the intersections along Kuhio Highway will operate at Level-of-Service D, or better.

There is some point between now (2005) and 2020 when the Bypass is needed in order to maintain acceptable levels-of-service along Kuhio Highway. The Bypass will divert 650 vehicles per hour during the morning peak hour and 450 vehicles per hour during the afternoon peak hour from Kuhio Highway. This date will have to be determined based on a review of traffic conditions as other roadway improvement projects are made in the area as well as community priorities.

6. CONCEPTUAL DESIGNS

The purpose of this chapter is to present the conceptual designs for the major roadway improvements within the study area and to discuss the resulting impacts of the levels-of-service. These roadway improvements include the following:

1. Realignment of Ahukini Road between Umi Street and Kuhio Highway

2. Signalization of the intersection of Kuhio Highway at Hardy Street and roadway improvements between Umi Street and Kuhio Highway

3. Roadway improvements along Rice Street between Hardy Street and Kuhio Highway

The engineering objective of the conceptual designs is to provided sufficient capacity for traffic to operate at acceptable levels-of-service. Therefore, the primary considerations in developing the conceptual designs are the required lane configurations as determined from the level-of-service analysis and the required left turn lane storage requirements. In addition to the engineering considerations, the need to landscaping space was also considered.

Prior to discussion of the conceptual designs, the standards used in the development of the conceptual designs is presented.

Standard for Left Turn Storage Lane Lengths

The left turn storage lengths required to accommodate estimated traffic volumes were calculated using guidelines in *A Policy on Geometric Design of Highways and Streets* published by the American Association of State Highway and Transportation Officials, 1990 edition. There are separate policies for signalized and unsignalized intersections. Based on this policy, the assumptions used to determine the required lengths of the left turn storage lanes are:

(1) For signalized intersections, the length of the left turn storage lane should be 1.5 to 2.0 times the average number of vehicles arriving during a signal cycle during the peak hour.

(2) For unsignalized intersections, the length of the left turn storage lane should be1.5 to 2.0 times the average number of vehicles arriving during a 60-second cycle.

(3) The average length required per vehicle is 25 feet.

(4) The traffic signal cycle lengths are 120 seconds. There is a direct relationship between the traffic signal cycle length and the length required for the left turn storage lane. A cycle length of 60 seconds will require half the storage length of a 120 second cycle. However, the existing traffic signals cycle lengths along Kuhio Highway were timed at approximately 120 seconds. Using 120 seconds as the cycle length will result in conservative calculations and allow flexibility in future modifications to the traffic signal system. However, this will result in longer queues lengths and limited space can become an issue.

(5) The minimum length of a left turn storage lane should be 60 feet, which is sufficient to accommodate one automobile and one medium size truck.

Ahukini Road between Umi Street and Kuhio Highway

The conceptual design for Ahukini Road between Umi Street and Kuhio Highway is shown as Figure 12. The major components of the plan are:

1. The intersection of Ahukini Road at Kuhio Highway is relocated approximately one block north of the existing intersection. Ahukini Road intersects Kuhio Highway at Ehiku Street rather than Oxford Street. The realigned section of Ahukini Road is north of Hilo Hatties rather than along the south side.

2. Traffic movements at the intersection of Old Ahukini Road at Kuhio Highway is restricted to right turns only. This is because the left turn storage length required for northbound to westbound left turns at the new intersection of Ahukini Road is longer than the distance between the two intersections.

3. Umi Street is extended across Ahukini Road, between Walmart to the hospital. This intersection is signalized.

The required lengths of the left turn storage lanes were determined using the criteria cited above and the peak hour left turn traffic projections presented in the previous chapter. The calculations are shown in Table 8.

Table 8 Turn Lane Length Requirements for Proposed Improvements Along Ahukini Road

Intersection	Approach	Design Volume	Cycle Length (Seconds)	Cycles per Hour	Average Vehicles per Cycle[2]	Required Length [1]				Length Recommended (Ft)
						Minimum		Desirable		
						Veh	Ft	Veh	Ft	
Ahukini Rd at Kuhio Hwy	EB	30	120	30	1	2	50	2	50	100
	WB	410	120	30	14	21	525	28	700	2@350" = 700'
Ahukini Rd at Umi St	EB	75	120	30	3	5	125	6	150	150
	WB	460	120	30	15	23	575	30	750	2@375' = 800'

NOTE:
(1) Minimum queue length is 1.5 time average number of vehicles. Desirable queue length is 2.0 time average number of vehicles.
(2) The average number of vehicles per cycle is calculated by dividing the design volume by the number of cycles per hour.

The results of the level-of-service analysis reflecting the proposed improvements are summarized in Table 9. As shown, all movements will operate at Level-of-Service D, or better, except the left turn from westbound Ahukini Road to southbound Kuhio Highway, which will operate at Level-of-Service E during the morning peak hour.

Table 9 Levels-of-Service - Ahukini Road Between Kuhio Highway and Umi Street

Intersection, Approach and Movement	AM Peak Hour			PM Peak Hour		
	V/C[1]	Delay[2]	LOS[3]	V/C	Delay	LOS
Kuhio Highway at Ahukini Road	0.68	22.8	C	0.76	30.9	C
Eastbound Left	0.23	34.8	C	0.79	46.8	D
Eastbound Thru & Right	0.15	16.2	B	0.17	40.4	D
Westbound Left	0.83	32.0	C	0.97	73.9	E
Westbound Thru & Right	0.66	8.3	A	0.25	31.9	D
Northbound Left	0.18	35.2	D	0.51	53.3	C
Northbound Thru	0.58	20.1	C	0.90	33.4	D
Northbound Right	0.45	4.6	A	0.26	18.0	B
Southbound Left	0.67	36.0	D	0.62	35.8	D
Southbound Thru & Right	0.75	15.0	B	0.53	15.5	B
Umi Street at Ahukini Road	0.61	19.9	B	0.80	22.7	C
Eastbound Left	0.35	29.2	C	0.45	29.3	C
Eastbound Thru & Right	0.69	22.0	C	0.78	25.2	C
Westbound Left	0.73	26.3	C	0.78	33.9	C
Westbound Thru & Right	0.73	16.4	B	0.60	17.7	B
Northbound Left & Thru	0.49	19.5	B	0.81	28.6	C
Northbound Right	0.04	13.5	B	0.14	11.3	B
Southbound Left & Thru	0.15	14.8	B	0.28	13.8	B
Southbound Right	0.12	14.2	B	0.16	11.4	B

NOTES:
1. V/C denotes ratio of volume to capacity.
2. Delay is in seconds per vehicle.
3. LOS denotes Level-of-Service calculated using the operations method described in *Highway Capacity Manual*. LOS is based on delay.
4. Volume-to-capacity ratios are not calculated for unsignalized intersections. Overall intersection delays and levels-of-service are also not calculated for unsignalized intersections.

Ahukini Road at Kuhio Highway

The right-of-way needed to provide the roadway improvements shown along Kuhio Highway may not be obtainable. Therefore, there may be sufficient right-of-way to provide only four lanes. The configuration would have to be comparable to that shown as Figure 13, which is for two lanes each for southbound and northbound traffic along Kuhio Highway. Turns would be shared with the through lanes. For this scenario, the intersection of Ahukini Road at Kuhio Highway will operate at Level-of-Service E during both peak hour. If the traffic signal phasing were to split the northbound and southbound phases, the intersection will operate at Level-of-Service F during both peak hours.

The left turn storage lane required for left turns from westbound Ahukini Road to southbound Kuhio Highway extends beyond the intersection of Ahukini Road with Akahi Street. Left turns from Akahi Street across the left turn storage lane will not be a safe maneuver. Accordingly, turning movements at the intersection of Ahukini Road at Akahi Street should be restricted to right turn only.

Impacts of Optimized Traffic Signal Timing Along Ahukini Road

In response to comments, an alternate design for Ahukini Road was developed based using optimized traffic signal cycle lengths, which has a direct impact of the left turn storage lane requirements. Reduction of the left turn lane storage length requirements may provide additional area that could be used for landscaping.

The optimum traffic signal cycle lengths were determined using Synchro 7. Separate cycle lengths were determined for morning and afternoon peak hours. It was also assumed that the intersections with Kuhio Highway and Umi Street would be synchronized meaning that both intersections would have the same cycle length. The optimum traffic signal cycle lengths for the morning and afternoon peak hours were determined to be 70 seconds and 90 seconds, respectively. The resulting left turn lane storage requirements are summarized in Table 10. As shown there is a significant reduction in the left turn storage length required. Since the lane configurations and cycle splits are the same as the previously discussed design, the impacts of the levels-of-service are negligible. A revised conceptual design using the revised signal cycle lengths is provided as Figure 14. The conceptual plan is shown for the alternative with widening along Kuhio Highway. The required lengths of the left turn storage lanes along the Ahukini Road approaches to Kuhio Highway will be approximately the same regardless of the number of lanes along Kuhio HIghway.

Table 10 Left Turn Lane Length Requirements for Proposed Improvements Along Ahukini Road With Optimized Traffic Signal Cycle Length

Intersection	Approach & Time Period		Design Volume	Cycle Length (Seconds)	Cycles per Hour	Average Vehicles per Cycle[2]	Required Length [1]				Length Recommended (Ft)
							Minimum		Desirable		
							Veh	Ft	Veh	Ft	
Ahukini Rd at Kuhio Hwy	EB	AM	30	70	51	1	2	50	2	50	100
		PM	20	90	40	1	2	50	2	50	
	WB	AM	370	70	51	7	11	275	14	350	2@250" = 500'
		PM	410	90	40	10	15	375	20	500	
Ahukini Rd at Umi St	EB	AM	50	70	51	1	2	50	2	50	100
		PM	75	90	40	2	3	75	4	100	
	WB	AM	460	70	51	9	14	350	18	450	2@225' = 450'
		PM	320	90	40	8	12	300	16	400	

NOTE:
(1) Minimum queue length is 1.5 time average number of vehicles. Desirable queue length is 2.0 time average number of vehicles.
(2) The average number of vehicles per cycle is calculated by dividing the design volume by the number of cycles per hour.

Elimination of Umi Street Extension

The extension of Umi Street north of Ahukini Road was added late in the study in response to future development north of and east of the existing Walmart. Based on a subjective assessment of traffic volumes and levels-of-service in the area, it was determined that is additional link would provide an alternative route to Kuhio Highway between Rice Street and the existing entrance to Walmart along Kuhio Highway, which has and will have low levels-of-service. Therefore, an improvement of conditions along this section of Kuhio Highway would result. A level-of-service analysis without this extension concluded that both morning and afternoon levels-of-service at the intersection of Kuhio Highway at Ahukini Road would decrease one level-of-service (ie: from Level-of-Service C to Level-of-Service D). The level-of-service of the intersection of Ahukini Road at Umi Street would be Level-of-Service B, morning and afternoon. This is the same level-of-service as for a four-legged intersection. A schematic drawing of this intersection without the extension is presented as Figure 15.

Hardy Street between Kuhio Highway and Umi Street

The conceptual design for Hardy Street between Umi Street and Kuhio Highway is shown as Figure 16. The major components of the plan are:

1. The intersection of Kuhio Highway at Hardy Street is signalized. There will be separate southbound to eastbound left turn phase. The existing southbound left turn lane will be retained and the westbound approach of Hardy Street will remain as existing, which is a left turn lane and a right turn lane. Under these conditions, the intersection will operate at Level-of-Service D during the morning peak hour and Level-of-Service E during the afternoon peak hour.

   If sufficient right-of-way can be obtained to provide a second left turn lane the morning and afternoon levels-of-service would be Level-of-Service D during both peak periods. The length needed for the westbound left turn storage lane would be reduced from 450 feet to 225 feet. This would eliminate potential backup through the upstream unsignalized intersection at Akahi Street.

2. It was assumed that the intersection of Hardy Street at Akahi Street will be signalized for 2020 conditions. This intersection is the north entrance to the Civic Center. The eastbound and westbound left turns will be protected and there will be separate left turn lanes.

3. The intersection of Hardy Street at Umi Street will be converted to a roundabout. The level-of-service analysis assessed the intersection as a two-way STOP sign controlled intersection and as a four-way STOP sign controlled intersection. For both cases, the intersection operated at Level-of-Service F. As a roundabout, the maximum volume-to-capacity ratio is 0.89, which implies Level-of-Service D.

The required lengths of the left turn storage lanes were determined using the criteria cited above. The calculations are shown in Table 11.

Table 11 Turn Lane Length Requirements for Proposed Improvements Along Hardy Street

Intersection	Approach	Design Volume	Cycle Length (Seconds)	Cycles per Hour	Average Vehicles per Cycle [2]	Required Length [1]				Length Recommended (Ft)	Notes
						Minimum		Desirable			
						Veh	Ft	Veh	Ft		
Hardy St at Kuhio Hwy	WB	270	120	30	9	14	350	18	450	275	Signalized
Hardy St at Akahi St	EB	60	60	60	1	2	50	2	50	60	Unsignalized
	WB	95	60	60	2	3	75	4	100	100	Unsignalized
Hardy St at Elua St	EB	130	60	60	2	3	75	4	100	100	Unsignalized

NOTE:
(1) Minimum queue length is 1.5 time average number of vehicles. Desirable queue length is 2.0 time average number of vehicles.
(2) The average number of vehicles per cycle is calculated by dividing the design volume by the number of cycles per hour..

Impacts of Optimized Traffic Signal Timing Along Hardy Street

The required lengths of the left turn storage lanes were determined using optimized traffic signal cycle lengths are shown in Table 12. Because there is insufficient length to provide the desirable lengths between Kuhio Highway and Akahi Street, the recommended lane lengths are the same as without the optimized cycle lengths.

Table 12 Turn Lane Length Requirements for Proposed Improvements Along Hardy Street With Optimized Traffic Signal Cycle Length

Intersection	Approach		Design Volume	Cycle Length [3] (Seconds)	Cycles per Hour	Average Vehicles per Cycle [2]	Required Length [1]				Length Recommended (Ft)	Notes
							Minimum		Desirable			
							Veh	Ft	Veh	Ft		
Hardy St at Kuhio Hwy	WB	AM	100	90	40	3	5	125	6	150	275	Signalized
		PM	270	80	45	6	9	225	12	300		
Hardy St at Akahi St	WB	AM	95	90	40	2	3	75	4	100	60	Signalized [4]
		PM	70	80	45	2	3	75	4	100		
	EB	AM	60	90	40	2	3	75	4	100	100	Unsignalized
		PM	40	80	45	1	2	50	2	50		
Hardy St at Elua St	EB	AM	130	60	60	2	3	75	4	100	100	Unsignalized
		PM	130	60	60	2	3	75	4	100		

NOTE:
(1) Minimum queue length is 1.5 time average number of vehicles. Desirable queue length is 2.0 time average number of vehicles.
(2) The average number of vehicles per cycle is calculated by dividing the design volume by the number of cycles per hour.
(3) The cycle length for unsignalized intersections is based seconds based on the AASHTO standards as discussed earlier in this chapter.
(4) As discussed in Chapter 5 of this report, the intersection of Hardy at Akahi Street may be signalized. Therefore, the lengths of the left turn storage lane were determined for signalized conditions since the lengths for signalized conditions are longer than for unsignalized conditions. This minimizes the possibility that the pertinent section of Hardy Street will have to be reconstructed when signals are installed.

Rice Street between Kuhio Highway and Hardy Street

The conceptual design for this section of Rice Street is shown as Figure 17. The major improvement is the widening of the Rice Street approach to Kuhio Highway to provide a double westbound to southbound left turn. With this improvement, the intersection will operate at Level-of-Service B during both peak periods. This can be accomplished with SDOT's project to widen Kaumualii Highway from two to four lanes.

The calculations for the required length of the left turn storage lane are shown in Table 13. The required length could not be provided because of the geometry of the intersection and constraints by existing buildings adjacent to the roadway. Reduction of the traffic signal cycle length to approximately 70 seconds would reduce the required length to match the recommended length.

Table 13 Turn Storage Lane Requirements for Proposed Improvements Along Rice Street

Intersection	Approach	Design Volume	Cycle Length (Seconds)	Cycles per Hour	Average Vehicles per Cycle	Required Length (1)				Length Recommended (Ft)
						Minimum		Desirable		
						Veh	Ft	Veh	Ft	
Rice St at Kuhio Hwy	WB	480	120	30	16	24	600	32	800	2@200' =400'

NOTE:
(1) Minimum queue length is 1.5 time average number of vehicles. Desirable queue length is 2.0 time average number of vehicles.

The optimized traffic signal lengths are 75 seconds for the morning peak hour and 90 seconds for the afternoon peak hour. This implies that there is sufficient length to accommodate morning peak hour queues.

NOTES:
1. V/C denotes ratio of volume to capacity.
2. Delay is in seconds per vehicle.
3. LOS denotes Level-of-Service calculated using the operations method described in *Highway Capacity Manual*. LOS is based on delay.
4. Volume-to-capacity ratios are not calculated for unsignalized intersections. Overall intersection delays and levels-of-service are also not calculated for unsignalized intersections.

1. V/C denotes ratio of volume to capacity.
2. Delay is in seconds per vehicle.
3. LOS denotes Level-of-Service calculated using the operations method described in *Highway Capacity Manual*. LOS is based on delay.
4. Volume-to-capacity ratios are not calculated for unsignalized intersections. Overall intersection delays and levels-of-service are also not calculated for unsignalized intersections.

MEMORANDUM

DATE: October 12, 2006

TO: Planning Director Ian K. Costa

FROM: Kauai Historic Preservation Review Commission

SUBJECT: Lihue Mill Complex

This is to inform you that the Kauai Historic Preservation Review Commission (KHPRC) met in January 2006 to discuss the status of the Lihue Mill Complex in light of preliminary inquiries for demolition permits for certain buildings at this historic site and the report on development options produced by the Planning Department.

Discussion focused on a letter sent to the KHPRC and the Planning Department elaborating on the historical significance of the Lihue Mill Complex and the need for comprehensive historical research and documentation and preservation alternatives prior to permitting activities at this site.

Based on the information provided, the KHPRC made the following recommendation at its January 5, 2006 meeting:

"The Kaua'i Historic Preservation Review Commission recognizes the Lihue Plantation mill as one of the most historic properties on the island and the historic reason why the town was established and developed in its current location. As such, the following actions are recommended:

✔ no demolition permits be granted for all or part of the mill without a comprehensive history first undertaken and all preservation alternatives reviewed,

✔ the owner initiate a two-stage program: a Scope of Work document created with the assistance of a professional consultant, and a subsequent compilation of the site's history.

These recommendations follow a 2005 report by the County of Kaua'i Planning Department, which recognizes the site's historic importance. Page 3 of that report states:

The mill site itself is historical from the perspective that it was central to the development of Lihue as Kauai's capitol. Also, most of the mill buildings are more than fifty (50) years old.

The historical aspects of the mill will play a vital role in the eventual development of the site from preservation of buildings along with an interpretive program to ensure that the "history" of the project site is not lost.

Compiling the history of the site will require an extensive amount of time to research and develop. However, "history" will play a very vital role in the planning process for the development of the property. At this point, it is extremely vital to recognize the historical importance of the site and have it incorporated into the planning process for development that will eventually follow the completion of this plan. The compilation of the mill's history will remain as one of the important tasks ahead in the planning process for its development.

Also important for the mill, is the role that the mill played in the building of Lihue and the evolution of its role in relation to the development of the town. This part of the mill's history is significant from the perspective that it is not only a historical site in and of itself, but its importance to the overall town and island."

Thank you for your consideration of the KHPRC's concerns regarding development impacts and preservation issues pertaining to this important historical complex.
